**CROSS REFERENCE TO RELATED
APPLICATIONS**

[0001] The present application claims the benefit of U.S. Provisional Patent Application No. 60/675,849 filed Apr. 29, 2005, the entire contents of which is hereby incorporated by reference.

FIELD OF THE INVENTION

[0002] The present invention is directed toward a portable information terminal mountable on a shopping cart and to an external memory device usable with same, and, more specifically, toward a portable information terminal having an opening configured to receive a portable memory device, the opening being protected by a door, and toward a portable memory device configured to open the door when inserted into the opening.

BACKGROUND OF THE INVENTION

[0003] Shopping carts have remained essentially unchanged in form for many years. Recently, however, with the availability of inexpensive, compact computing power, attempts have been made to add small computers to shopping carts to assist users with shopping. For example, it is known to attach bar code readers to shopping carts to allow users to perform price checks and/or to perform a self-check out. One example of such a system is disclosed in U.S. Pat. No. 5,361,871 to Gupta, the contents of which are hereby incorporated by reference. However, the Gupta device appears likely to interfere with proper cart nesting and requires an electrical contact depending from the bottom of the cart for recharging which would likely be damaged in moving the cart through store aisles and/or over curbs in a store parking lot. It is not believed that systems such as the one disclosed in Gupta have been widely adopted.

[0004] Related shopper-assisting devices that clip or otherwise detachably mount to a shopping cart handle are also known. However, these must be taken from a rack or other storage location by a user and attached to a cart handle before use. When a shopper reaches the check-out line, store personnel must detach the unit from the car and return the unit to a storage and/or charging station or rely on the customer to perform these actions. It is believed that these inconveniences have kept such devices from being widely adopted.

[0005] It would therefore be desirable to provide an electronic shopper assisting device that is easy to use and maintain and that does not suffer from the aforementioned drawbacks.

SUMMARY OF THE INVENTION

[0006] These problems and others are addressed by the present invention, a first feature of which is a system comprising a portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store and an external memory device connectable to the portable information terminal. The external memory device includes a memory

housing, a non-volatile memory storing data in the memory housing and a first electrical connector projecting from the housing for allowing a processor to access the stored data. The portable terminal includes a terminal housing including a display, a processor in the terminal housing for causing the display to display product information and advertisements, and a second electrical connector inside the housing complementary to the first electrical connector for connecting an external memory device to the processor. The terminal housing including a passage providing access to the second electrical connector from outside the terminal housing and at least one door recessed in the passage shiftable from a first position blocking the passage to a second position by inserting the external memory device into the passage.

[0007] Another aspect of the invention comprises a portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store. The terminal comprises a housing including a display, a processor in the housing for causing the display to display product information and advertisements and an electrical connector inside the housing for connecting an external memory device to the processor. The housing includes a passage providing access to the electrical connector from outside the housing and a door recessed in the passage and shiftable between a first position blocking the passage and a second position by inserting an external memory device into the passage.

[0008] Another feature of the invention comprises an external memory device usable with a system comprising a portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store and an external memory device connectable to the portable information terminal. The external memory device includes a memory housing, a non-volatile memory storing data in the memory housing, a first electrical connector projecting from the housing for allowing a processor to access the stored data, and a projecting member projecting from said memory housing adjacent to said first electrical connector.

BRIEF DESCRIPTION OF THE DRAWINGS

[0009] Various aspects and features of embodiments of the present invention will be better understood after a reading of the following detailed description together with the accompanying drawings wherein:

[0010] **FIG. 1** is a front perspective view of a portable information terminal having a housing holding an electronic module and having passage for receiving a removable memory device according to an embodiment of the present invention;

[0011] **FIG. 2** is a rear perspective view of the information terminal of **FIG. 1**;

[0012] **FIG. 3** is a front elevational view of the information terminal of **FIG. 1**;

[0013] **FIG. 4** is a side elevational view of a first removable memory device for use with the information terminal of **FIG. 1**;

[0014] **FIG. 5** is a side elevational view of a second removable memory device for use with the information

terminal of **FIG. 1** that includes a projection for releasing a latch on a door in the housing;

[0015] **FIG. 6** is a top plan view of the removable memory device of **FIG. 5** with its cap removed;

[0016] **FIG. 7** illustrates a passage in the housing of **FIG. 1** for receiving the memory device of **FIG. 5**;

[0017] **FIG. 8** illustrates the memory device of **FIG. 5** being received in the passage of **FIG. 7**;

[0018] **FIG. 9** illustrates an information terminal according to an embodiment of the present invention used with a cart wheel locking device wherein the wheel locking device is controlled by the information terminal;

[0019] **FIG. 10** illustrates the wheel locking device of **FIG. 9** locking a cart wheel when a memory device is not present in the information terminal;

[0020] **FIG. 11** illustrates the wheel locking device of **FIG. 9** unlocking a cart wheel when a memory device is inserted into the passage in the information terminal housing;

[0021] **FIG. 12** schematically illustrates the nesting of several shopping carts which carts include the information terminals of **FIG. 1**;

[0022] **FIG. 13** is a perspective view of several nested carts that include the information terminals of **FIG. 1** wherein the information terminals are electrically interconnected for battery recharging;

[0023] **FIG. 14** illustrates a plurality of nested carts including a second embodiment of an information terminal connected to a handle according to the present invention having batteries being recharged by a corral having charging rails;

[0024] **FIG. 15** is a perspective view of one end of the handle of **FIG. 14**;

[0025] **FIG. 16** is an elevational view of the end of the handle of **FIG. 15**;

[0026] **FIG. 17** schematically illustrates an information terminal mounted on a handle connected between two charging rails of the corral of **FIG. 14**;

[0027] **FIG. 18** illustrates a third embodiment of the information terminal in which electrical connectors are integrated with a locking device for securing adjacent carts to one another;

[0028] **FIG. 19** illustrates one of the electrical connectors of **FIG. 18** in a housing on an adjacent cart;

[0029] **FIG. 20** is a plan view of the connector end of **FIG. 19**;

[0030] **FIG. 21** illustrates a charging rail and guide channel arrangement for charging the battery of an information terminal connected to a handle;

[0031] **FIG. 22** is a sectional view of an end of the handle and charging rail of **FIG. 21**;

[0032] **FIG. 23** illustrates a first handle grip cross section;

[0033] **FIG. 24** illustrates a second handle grip cross section;

[0034] **FIG. 25** illustrates a third handle grip cross section;

[0035] **FIG. 26** is a schematic elevation view illustrating a door in the passage of **FIG. 1**;

[0036] **FIG. 27** is a schematic elevation view of a memory device holding open the door of **FIG. 26**;

[0037] **FIG. 28** is a schematic elevation view of first and second doors in the passage of **FIG. 1**;

[0038] **FIG. 29** is a schematic elevation view of a memory device holding open the doors of **FIG. 28**;

[0039] **FIG. 30** is a schematic elevation view of a first latch in a latching position for securing the door of **FIG. 26**;

[0040] **FIG. 31** is a schematic elevation view of the latch of **FIG. 30** in an unlatched position;

[0041] **FIG. 32** is a schematic elevation view of a third latch for securing the door of **FIG. 26**;

[0042] **FIG. 33** is a schematic elevation view showing two of the latches of **FIG. 32** securing the door of **FIG. 26**;

[0043] **FIG. 34** is a plan view of two doors in the passage of **FIG. 1**;

[0044] **FIG. 35** is an elevational view schematically illustrating a latch for securing the doors of **FIG. 34**;

[0045] **FIG. 36** is an elevational view schematically showing the latch of **FIG. 35** being opened by the memory device of **FIG. 5**; and

[0046] **FIG. 37** is an information terminal without connected grip portions.

DETAILED DESCRIPTION

[0047] Referring now to the drawings, wherein the showings are for purposes of illustrating preferred embodiments of the invention only, and not for the purpose of limiting same, **FIG. 1** illustrates an information terminal in the form of a cart handle **10** comprising first and second grips **12** extending from a central housing **14**. Central housing **14** includes a display **16**, preferably a touch screen display, and a hollow interior for containing an electronic module or modules, a battery **15**, illustrated in **FIG. 17**, a circuit board, a bar code reader **17**, and other functional elements discussed herein. Housing **14** includes a first or front portion **18** formed integrally with grips **12** and a rear portion **20** mounted to front portion **18** either removably using fasteners such as screws or via a snap fit, or permanently using suitable adhesives, for example. When rear portion **20** is removably mounted, a suitable gasket is provided to ensure an watertight seal that will at the same time allow the unit to breathe and minimize condensation build up in the hollow interior of housing **14**.

[0048] While the information terminal of **FIG. 1** includes attached grip portions **12**, it is also possible to form the information terminal **10** without grip portions **12** and instead provide mounting hardware (not shown) for connecting an information terminal **10'** to an existing cart handle. An information terminal **10'** without grip portions **12** is illustrated in **FIG. 37**.

[0049] Grips **12** include gripping portions **21** and join housing **14** at reinforced portions **22** to increase the strength of handle **10** and to reduce the likelihood of damage where

the grips **12** join housing **14** when the handle is pushed or pulled or when downward pressure is applied against the housing **14**. The gripping portions **21** have a circumference (or periphery if the grip portion does not have a circular cross section) of about 3 inches or 8 centimeters over most of their length to make them comfortable to grip for a user. Reinforced portions **22** are flared and have a larger circumference or periphery which increases from the periphery of the gripping portion **21** to the sidewall of housing **14**. As will be appreciated from **FIGS. 1 and 2**, the flared reinforced portion **22** surrounds the gripping portions **21** of grips **12** on all sides so that a cross section of the gripping portion **21** projected toward housing **14** will pass through without intersecting the largest circumference or periphery of reinforced portions **22**.

[0050] The housing and internal components are adapted to operate over a wide range of temperatures, -45°C. , to 70°C. , for example, so that the device can, for example, be stored outdoors in both extreme winter conditions and in direct sunlight in summer, and be resistant to both moisture and the impacts that are likely to be suffered by a shopping cart handle. The grips and housing are preferably formed from a suitable thermoplastic material.

[0051] Battery **15** is rechargeable and should be capable of operating the electronic modules for approximately 16 hours before recharging.

[0052] Housing **14** includes an opening **24** for receiving a modular bar code reader **17** and a passage **28** providing access to an internal I/O port or connector **30**, illustrated in **FIG. 8**, for example, which in the presently preferred embodiment comprises a USB port. Hardware contained within housing **14** will perform various functions and provide various displays on screen **16** which functions and displays do not comprise a part of the present disclosure.

[0053] The hardware in housing **14** may be activated by inserting an activation device into port **30**. In the present embodiment, the activation device comprises a solid state storage device **32** having a USB interface compatible with port **30**. Alternately, the electronic module could be activated using bar code reader **17** to scan a bar code carried by an authorized user—on a customer loyalty card, for example. When storage device **32** is used, information about a user on device **32** can optionally be made available to a processor in housing **14** and/or transmitted to a central server in wireless communication with electronic cart handle **10**.

[0054] Memory device **32** can be used to receive and store information from information terminal **10** or a server in communication with the terminal which information a user may later access using, for example, a home computer. Where privacy is an issue, device **32** may merely contain a serial number to identify the device **32** to a secure server in communication with the electronic module. In such cases, no personal information would be stored on device **32**. This would substantially prevent the disclosure of private information if a device **32** is lost. For purposes of the present disclosure, it is merely necessary to know that an authorized user can be identified to a processor in housing **14** with either device **32** or a bar code on a customer loyalty card, and that a processor in the electronic module, which may for example be in wireless communication with a server and/or

the internet, can provide information to the user of the information terminal **10** based on previously stored preferences.

[0055] Removable memory device **32** is illustrated in **FIGS. 4, 27 and 29** and includes a body portion **34** in which a suitable compact flash or other solid-state memory **35** is contained, a USB connector **36** insertable into port **30**, a cap **38** and a ring **40** or similar arrangement to allow device **32** to be connected to a key ring.

[0056] As discussed above, information terminal **10** is adapted for use both indoors and out of doors and therefore must be weather resistant. For this reason, it is not practical to place an exposed USB or other I/O port on the exterior of the housing **14**. Instead, with reference to **FIGS. 26 and 27**, it is desirable to provide a closure to protect the connector **30** and the interior of the housing. While **FIG. 1** illustrates passage **28** on the upper part of housing **14**, it may be provided at other locations of the housing **14** as well, and generally will be provided toward the lower portion of housing **14** and/or in an upwardly angled manner to minimize direct expose to rain and snow.

[0057] In one embodiment, a door **150**, illustrated in **FIGS. 26 and 27** is provided in passage **28**. Door **150** forms a seal with the sidewalls **152** of passage **28** to minimize the entry of moisture into this opening in housing **14**. Door **150** is biased toward the closed position illustrated in **FIG. 26** by a spring **154** but may be swung open on hinge **156** when memory device **34** is inserted into passage **28** as illustrated in **FIG. 27**. As will be appreciated from these figures, door **150** will swing closed under the influence of spring **154** when memory device **34** is removed from the housing **14**.

[0058] **FIGS. 28 and 29** illustrate a different closure arrangement for passage **28** that include first and second doors **160** in passage **28** each biased toward a closed position by a spring **162**. As illustrated in **FIG. 29**, inserting memory device **34** in passage **28** opens doors **160** against the biasing force of springs **162** to provide access to port **30**. Doors **160** return to a closed position under the influence of springs **162** when memory device **34** is removed from passage **28**.

[0059] It may sometimes be desirable to provide a latch for securing a door **150** or doors **160** to reduce the chance of foreign objects being inserted into passage **28**. The size of passage **28** will generally be smaller than an adult finger, but a child might be able to damage port **30** with a small stick or similar object. While an adult intent on damaging information terminal **14** will likely be able to defeat such a latch, with a hammer and a screwdriver, for example, the added security provided by a latching mechanism will deter more casual tampering with internal components.

[0060] A first latching mechanism is illustrated in **FIGS. 30 and 31** installed on a door **150** of **FIG. 26**. This mechanism comprises a latching member **170** slidably mounted on door **150** and biased by a spring **172** into an opening **174** which may be provided in a wall of housing **14** or by a separate catch member **176** illustrated in **FIGS. 30 and 31**. A pin **178** extends through door **150** and is held in the raised position of **FIG. 30** by a spring **180**. A wire **182** is connected to one end of pin **178** and extends via a staple **184** to the end of latching member **170**. When pin **178** is depressed by memory device **34** as illustrated in **FIG. 31**, wire **182** pulls latching member **170** away from catch member **176** and allows door **150** to open under the force of memory device **34**.

[0061] An alternate latching arrangement is illustrated in FIGS. 32 and 33 wherein door 150 is prevented from opening by one or more latch members 190. Each of the latch members 190 includes a cam surface 192 projecting from the sidewalls 152 of passage 28 and a latch end 194 adjacent door 150. Inserting a memory device 34 into passage 28 therefore pushes outwardly on cam surface or surfaces 192 and moves latch end or ends 194 out from under door 150 thereby allowing door 150 to be opened when a memory device 34 is pressed thereagainst. Latch members 190 operate independently of one another. Therefore, when two or three latch members 190 are provided, it becomes difficult to actuate all latch member 190 simultaneously without using a memory device 34 or a similarly sized and shaped object.

[0062] An alternate memory device 42 is illustrated in FIG. 5. Memory device 42, in addition to a body portion 44 holding solid state memory 35, a USB connector 46, a cap 48 and a ring 50, includes a projection or key member 52 having a predetermined shape, which is a cross in the present embodiment. The shape of key member 52 matches the shape of a key opening 54, illustrated in FIGS. 7 and 34-36, in a housing adjacent port 30. Key member 52 fits into key opening 54 when memory device 42 is used. Key member 52 projects further from body 44 than connector 46 and thus enters key opening 54 and actuates a release mechanism 56 which unlocks doors 58 over port 30. Release mechanism 56 includes a cam 200 pivotable about an axis 202 and connected to a latch 204 so that pressure applied by projection 52 against cam 200 turns the cam and pulls latch 204 away from door 58, thereby allowing doors 58 (only one of which is shown in FIGS. 35 and 36) to swing inwardly under when USB connector 46 presses thereagainst. And, because projection 52 extends further from memory device housing 44 than USB connector 46, latch 204 remains the retracted position illustrated in FIG. 36 until doors 58 have closed behind memory device 42 as it is withdrawn from passage 28. This arrangement makes it more difficult for a user to use an unauthorized device in USB port 30. Key 52 may be retractable, with a thumb slide 53, for example, as illustrated in FIG. 5, to make USB drive 30 usable with standard USB ports, such as the ports found on a user's home computer.

[0063] In addition to activating electronic modules in housing 14, the insertion of memory device 32 or 42 can perform a security function as well. As illustrated in FIGS. 9-12, the cart 59 to which information terminal 10 is attached may include a wheel locking arrangement for securing the wheels 60 of shopping carts. These wheel locking devices may comprise a solenoid 62 for selectively driving a rod 64 into an opening in wheel 60 to substantially prevent wheel 60 from turning. Solenoid 62 is controlled by signals from the processor in housing 14 and only unlocks wheels 60 when an authorized memory device 32, 42 is inserted into port 30.

[0064] FIG. 12 illustrates a plurality of nested shopping carts 70 equipped with information terminals 10. The size and position of housing 14 substantially prevents the terminals 10 from interfering with cart nesting when mounted on a variety of standard carts. In addition, information terminal 10 is preferably mounted so that display 16 makes an angle of about 30 degrees with respect to the horizontal to improve visibility and minimize glare, while not interfering with the use of a child seat in the cart or with cart nesting.

[0065] FIG. 13 illustrates a daisy chain arrangement for recharging batteries 15 contained within housing 14 of a plurality of nested carts 80, 82, 84. As will be apparent from these figures, each housing 14 includes a power cord 86, a power outlet 88 and a power LED 90 which lights when power is being supplied to the cart on which LED 90 is mounted. The power cord 86 on first cart 80 is attached to a suitable DC power source 92 (such as a transformer connected to an AC power source), the power cord 86 of second cart 82 plugs into power outlet 88 of the first cart 80, and the power cord 86 of third cart 84 plugs into power outlet 88 of second cart 82. LED's 90 on each cart turn on when that cart is connected to a source of electric power. In this manner, it can readily be determined whether all carts in a nested series are being recharged. This arrangement is best suited for a last-in first-out arrangement of carts and therefore is primarily intended for situations wherein groups of carts are connected and fully charged, overnight, for example, before being used by purchasers. In an alternate arrangement, each of the plurality of nested carts could be plugged individually into a power source until fully charged. This would allow for the carts that have been charging the longest to be removed from a series of carts first, over the course of a business day.

[0066] FIG. 14 illustrates a cart corral 100 having first and second rails 102 each of which is provided with an electrically conductive charging rail 104, best seen in FIG. 17, connected to a power source 103. Corral 100 includes first and second angled guide members 106 for guiding a cart into the corral. Electrical contacts 108 on the ends of grip portions 12 make electrical contact with these charging rails to recharge a battery 15 inside housing 14. The contacts 108 may alternately be formed in separate end caps 107 which can be attached to the grip portions 12 after grip portions 12 are cut to a proper length. Either contacts 108 or charging rails 104 may be flexible or displaceable to ensure a good electrical connection between contacts 108 and charging rail 104 even when the separation between rails 102 and or the separation between the ends of handle 10 is not constant. Alternately, end caps 107 can be telescopically mounted within handle grip portions 12 and spring biased away from one another to accommodate variations in the separation between the charging rails. Corral 100 may further include hinged flaps 112 or similar structures to ensure that carts pass through the corral in a single direction and that the cart that has been charging for the longest period time is removed first to provide for first in first out recharging.

[0067] FIG. 18 illustrates a charging system integrated into a daisy chain cart security system. In such a security system, nested carts are secured by inserting a member 114 chained to one cart into a slot 116 on an adjacent cart. The member 114 may be released by inserting a coin or token to release a single cart. The coin or token is returned when the cart is returned to the nested line of carts after use. An example of such a daisy chain locking system (which does not include the electrical charging system of the present invention) is illustrated in U.S. Pat. No. 4,474,282 to Lender, the contents of which are hereby incorporated by reference.

[0068] As illustrated in FIGS. 19 and 20, member 114 includes a hasp 115 that connects to a locking mechanism in slot 116 and electrical contacts 118 that engage electrical contacts 120 in slot 116 to electrically connect two carts.

Electrical contacts **120** in slot **116** are in turn connected by wire **121** to the electrical contacts **118** of a member chained to that cart which can be inserted into a slot **116** of an adjacent cart in a similar manner to electrically connect and mutually secure a plurality of nested carts in series.

[0069] **FIG. 21** illustrates a recharging system that comprises a single rail **130**, mounted, for example on a wall **132**. Rail **130** includes a channel **133** in which a pair of spaced electrical contacts **134** are mounted, one above the other for making electrical contact with a pair of vertically projecting electrical contacts **136** on the end of a cart handle **138**. A guide channel **140** is provided on the ground adjacent rail **130** to help guide the cart wheels and properly position cart handle **138** with respect to rail **130**. This arrangement is space-efficient and allows for the recharging of a battery through a single end of a cart handle.

[0070] The present invention has been described herein in terms of several preferred embodiments. Obvious additions and modifications will become apparent to those skilled in the relevant arts upon a reading of the foregoing description. It is intended that all such obvious modifications and additions be included within the scope of this invention.

We claim:

1. A system comprising a portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store and an external memory device connectable to the portable information terminal,

the external memory device comprising:

a memory housing;

a non-volatile memory storing data in the memory housing; and

a first electrical connector projecting from the housing for allowing a processor to access the stored data;

the portable terminal comprising:

a terminal housing including a display;

a processor in the terminal housing for causing the display to display product information and advertisements; and

a second electrical connector inside the housing complementary to the first electrical connector for connecting an external memory device to the processor;

the terminal housing including a passage providing access to the second electrical connector from outside the terminal housing, and at least one door recessed in said passage shiftable from a first position blocking said passage to a second position by inserting the external memory device into the passage.

2. The system of claim 1 wherein said memory housing has a cross sectional shape and said passage has a shape complementary to said cross sectional shape for slidably receiving said memory housing.

3. The system of claim 1 including a latch shiftable between a latched position preventing said at least one door from shifting from said first position to said second position and an unlatched position allowing said at least one door to be shifted from said first position to said second position.

4. The system of claim 3 wherein said latch includes an actuating portion projecting into said channel.

5. The system of claim 4 wherein said memory housing includes a portion for engaging said actuating portion.

6. The system of claim 4 wherein said latch includes an actuating portion on said at least one door.

7. The system of claim 5 wherein said actuating portion is positioned to be actuated by said first electrical connector when said memory device is inserted into said passage.

8. The system of claim 1 including at least two latches each shiftable between a latched position preventing said at least one door from shifting from said first position to said second position and an unlatched position allowing said at least one door to be shifted from said first position to said second position.

9. The system of claim 1 wherein said at least one door is spring biased toward said first position.

10. The system of claim 3 wherein said memory housing includes a projection adjacent to said first electrical connector for shifting said latch to said unlatched position.

11. The system of claim 1 wherein said at least one door comprises first and second doors.

12. A portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store comprising:

a housing including a display;

a processor in the housing for causing the display to display product information and advertisements;

an electrical connector inside the housing for connecting an external memory device to the processor;

the housing including a passage providing access to the electrical connector from outside the housing, and at least one door recessed in said passage and shiftable between a first position blocking said passage and a second position by inserting an external memory device into the passage.

13. The portable information terminal of claim 12 wherein said at least one door comprises at least one door hingedly connected to the housing.

14. The portable information terminal of claim 13 including a latch shiftable between a latched position preventing said at least one door from shifting from said first position to said second position and an unlatched position allowing said at least one door to be shifted from said first position to said second position.

15. The portable information terminal of claim 14 wherein said latch includes an actuating portion projecting into said channel.

16. The portable information terminal of claim 14 wherein said latch includes an actuating portion on said at least one door.

17. An external memory device usable with a system comprising a portable information terminal mountable on a shopping cart for providing product and advertising information while the cart is moved inside a store and an external memory device connectable to the portable information terminal,

the external memory device comprising:

a memory housing;

a non-volatile memory storing data in the memory housing;

a first electrical connector projecting from the housing for allowing a processor to access the stored data; and

a projecting member projecting from said memory housing adjacent to said first electrical connector.

18. The external memory device of claim 17 wherein said projecting member has a cross section selected to correspond to the cross section of an opening in an information

terminal with which the external memory device is to be used.

19. The external memory device of claim 17 wherein said projecting member is retractably mounted on the memory housing.

20. The external memory device of claim 19 including a slide for retracting said projecting member.
